Money types and creation of the money:

Money is one of the most important tools, a basic need, the only reason for war and murder, peace and tranquility, progress and mustiness, cause of looting, and in general money is power or anything you desire to be.

What is money and how it's created?

Everyone knows money as printed money (banknotes), coins, digital data, or multi-digit numbers in bank accounts.

What do rich countries have that they offer their wealth to themselves and their people?!

They have resources like oil, gold, jewelry and etc. that are natural resources and reserves and by relying on these they can get necessary authorizations for printing money and after providing the basic needs like printing place, money blueprint, paper and ink and etc. they attempt printing physical money.

The money's worth is calculated based on these initial resources; however, these resources are limited in size, quantity, and the type and money printing authorizations issued depending on the worthiness of the initial resource, it is worth mentioning that there are other factors playing role in printed and in general currency worthiness. Of course, we are not interested in that type of money in these articles and we are discussing raw money data of huge amounts.

Mining of the unit of currency looks like subatomic particles; creating money is an art and the main power is the creator, not the creation (money); there is in fact fear of the creator not the money (creation). Our discussion here is to create money for developing good intentions around the world.

Money in the virtual network is a sub-particle; production and collection and aggregation of it is very difficult and far from the public imagination. By collecting these micro particles, unnamed particles are formed and upon creation of a raw unit of money it goes through an off-ledger monetization procedure and it will convert into one of the popular currencies in the world and it can be presented and injected into the banking and economic system of the world. It is safe to say that more than **90%** of these money units convert into European Union currency (**EURO**). For converting raw money data to a currency, **7/8** must be spent to create **1/8** offline currency like Euro

and that remained **1/8** offline money after paying some legal expenses, taxes and expenses converts into real printed money which is clean, legal, and clear.

Money types:

The money created in the farm network is monetized with different methods and depending on the costs and taxes divided in Clean and Dirty money which they are divided into online and offline. Our subject is the off-ledger fund and its creation procedure.

Banking network in farm:

Farm network and its extended programing, in simple words, is the Terminal Dive of all banking networks including offline and online banking and transferring of bank's server money.

Terminal Dive: it is a virtual space (Terminal) consisting of various lines and it has different platforms (Dives) for transferring money in the offline and online banking networks.

In previous articles we explained that there is no fund or money in farm **42**; this farm only and only is an archive of documents for funds in the farm and all documents are issued from this farm. funds are in farm **43** (clean and clear) to farm **92** (dirty and illegal funds).

Servers are named based on **HS, BS, DS,** and **NS**, banking servers are **NS** types and these servers are divided into offline (off-ledger) and online (on-ledger).

Servers that are active in offline banking are named **NS** which are consist of (**NS0, NS1, NS2, NS3, NS4, NS5, and NS6**) and servers that are in online banking are named **MS** that is consist of (**MS0, MS1, MS2, MS3, MS4, MS5, and MS6**).

Important to understand that the technical term of the funds available in online banking is **MS0** to **MS6** (publicly known as **M0** to **M6**) and off-ledger funds are **NS0** to **NS6** or **N0** to **N6**.

Dirty funds are the ones that cannot be monetized. E.g., bubbles, bugs, corrupted boxes, and mirrored boxes, and all of them are created by hackers.

The funds that have the ability to be boxed are only **M0** and **NS0** funds. **DTC** boxes can easily be created out of them and various types of transactions can be done (**IP/IP, IP/ID, MT103 Manual Download and etc.**)

M0 and **NS0** funds are only clean and clear funds in the farm that have full documents and can be transferred with authorizations in the banking system.

M0 and **NS0** owners are handfuls and all of them are part of the farm board and inspectors.

Server money types:

Off-ledger and on-ledger funds are processed and monetized based on their initial raw data. In the following table we introduce an off-ledger and on-ledger equivalents:

Off-ledger funds (NS)	On-ledger funds (MS)	Description of status
NS0 or N0	MS0 or M0	Completely clean and clear funds with full documents
NS1 or N1	MS1 or M1	Very clean and clear funds with documents
NS2 or N2	MS2 or M2	Clean funds with monetization ability
NS3 or N3	MS3 or M3	Dirty funds with monetization ability with incomplete documents
NS4 or N4	MS4 or M4	Dirty funds with monetization ability without documents
NS5 or N5	MS5 or M5	Dirty funds, funds without origin or blocked
NS6 or N6	MS6 or M6	Dirty and illegal funds

1. M0 or NS0 Funds: These funds are totally clean, clear, and legal and its documents are complete, so with payment of the taxes, costs, and expenses specific for every country fund be monetized, and once monetized it can be transferred by **MT103 Normal**. These funds are out of reach of hackers.

2. M1 or NS1 Funds: These funds are clean and legal and they have enough documents and can be monetized but mostly they are used for getting banking credits or loans and bonds. Their monetization costs are more than the previous type and hackers don't have access to these.

3. M2 or NS2 Funds: These funds are clean and legal but their documents are incomplete; they can be monetized and the monetization cost is more expensive than the previous type. This type of fund is mostly used for box mirroring, for this a bubble is created and transferred and after locating the bubble, they will equate the bubble with the original source and provide and define new documentation for it, with that new documentation defined for the bubble, push the original source to the monetization stage. Hackers don't have access to them.

4. NS3 or M3 Funds: these funds are dirty and illegal and their documentation is too incomplete; these funds can be monetized and their costs and expenses are far more expensive than the previous type. These funds need a couple of transfers in the banking system and lines to be converted into a clean fund and monetization and for transfers, they need more documents. For this purpose, usually, methods like box mirroring or other methods are used to push the fund to the monetization stage. This type is the main professional hackers' source and obviously, they can be accessed by them.

5. NS4 or M4 Funds: these funds are dirty and illegal, has no documents and in fact, they are raw money that has passed the stage of belonging to a currency like a euro, they can be monetized but because they don't have documentation and their taxes, costs, and expenses haven't been paid, any kind of use of these funds are considered money laundering. These funds can be accessed by hackers and mostly amateur hackers use this type.

6. NS5 or M5 Funds: these funds are undocumented, dirty, illegal. They can be monetized but their monetization cost is very, very expensive. These funds have no root, no owner, and they are mostly obtained from illegal illegally (drug smuggling, human trafficking and etc.). they are either blocked and untransferable or in the on-ledger network, they are being used for buying weapons, body organ trafficking and etc. these funds can be accessed by hackers.

Company E-Mail: info@suilcoltd.com

Inquiry E-Mail: inquiries@suilcoltd.com

7. NS6 or M6 Funds: these funds are totally dirty and illegal, they have no documents, can be monetized but the cost of their monetization is stunning. In fact, this money is the raw data that is waiting to be converted into a currency but robbed and transferred without authorization by hackers and a currency defined for with various hacking methods and injected into the banking network for disruption purposes.

Funds gained from trading platforms in on-ledger or off-ledger networks depending on their documents and after monetization and changing of the identity will be listed under **NS0-M0** or **NS1-M1** or they will be listed in dirty money types.

NS0 and **NS1** funds are off-ledger funds that after getting the necessary authorization and payment of the taxes, costs and expenses will enter to the on-ledger network and after it is deposited in the beneficiary account can be used according to the on-ledger banking network regulations.

M0 and **M1** funds are on-ledger funds that the general public can use (**in case of ownership**) for daily trades like cheques, using POS machines for buying daily needs and etc.

It is important to consider that **IP/IP, IP/ID, DTC,** and **Manual Download** for monetization and converting to on-ledger funds are only and only sent from **NS0-M0** fund resources.
